

## Internet

### Dial-up connection / connectivity. dial-up:

The connection of internet by using existing / new telephone line connection. It requires the MODEM to connect to computer.

Start → Control Panel → Network & Sharing Center → set up a new connection or network → click set up a dialup connection → click next → modem sony ericsson → dialup there no

~~tested.~~

E-mail: - It stands for Electronic mail is the service that is available to people on a local area network or on the global internet. It is one of the most commonly used services on the internet, as this service is more convenient than normal postal system. It is easier to send e-mail than postal mail, as we don't need to paste a stamp or search for an envelope, just create the message and send it.

E-mail doesn't require the person receiving the mail to be available at the time of receiving the mail.

## Basic concept

- we put an e-mail message into electronic envelope and place an electronic address on it.
- we then hand over the envelope to someone else (the network) for delivery.
- we don't worry, when the e-mail is read.
- we can forward e-mail to a forwarding address.
- our message may come back to us if our mail can't be delivered (this is called bounced mail as it "bounces" back to us)
- our mailbox may become full of e-mail, we may get mail which might be difficult to read.
- An electronic magazine or a mailing list subscription may provide us with the latest trends in the topics of our interest
- commercial companies may send us their advertisement through e-mail (this is also called "junk" mail)
- our mail may be delivered to, and read by, someone else.
- every piece of e-mail we get may not be pleasant and friendly.

The common points b/w e-mail and postal mail are:

- The sender should know our e-mail address.
- we can keep in touch with our friends using e-mail.
